Subject: Screening Site Investigation Report

General Wood Preserving Co., Inc. NCD093137636

Hwy. 74-76, Wood Treatment Road Leland, Brunswick County, NC 28451

Dear Mr. Morris:

Please find attached the site investigation report for the subject site. Based on data collection and evaluation, and on analyses of samples taken from the site, we have concluded the following:

General Wood Preserving Co., Inc., (GWP Co.) is located near the town of Leland, in Brunswick County, North Carolina. The site was developed by Burke-Parsons-Bowlby Corp. (BPB Corp.) in 1979 as a wood preserving facility. The property was an undeveloped wooded area when the facility was built. In August of 1984, the facility was sold to General Wood Preserving Co., Inc. The property consists of approximately 120 acres, of which approximately the western half has been developed for wood treatment and storage. The remainder of the property is undeveloped and wooded.

The facility was designed to be a complete recycle, non-discharge facility that would effectively contain all toxic and hazardous chemicals used in the treatment process. Under BPB Corp., however, an increase in production, poor operating procedures, spills, and alleged improper waste disposal all helped to contribute to documented soil, groundwater and surface water contamination. Several consent agreements were reached with the State of North Carolina and BPB Corp. funded remedial work at the site. After the Mr.

Robert Morris September 28, 1989 Page 2

facility was sold to General Wood Preserving Co., the new owners appeared to have improved operating conditions. However, in April of 1988, acting in response to a complaint from a former employee that alleged improper waste disposal, state investigators took samples from five areas and found contamination from PCP, Arsenic, Chromium, and creosote constituents. GWP Co. was subject to a Compliance Order with civil penalty assessment in October of 1988. In addition, a criminal investigation was launched by Federal officials. A judgement was entered against General Wood Preserving Co on February 15, 1989 and a penalty was assessed. GWP Co. is paying this fine in installments and has retained Westinghouse Environmental Services to perform work required by the Compliance Order.

The site has been inspected and sampled several times by personnel from the NC Solid Waste Management Division. For this reason, personnel from the NC Superfund Section did not conduct a site investigation visit. All sample data presented in this report are from sample results from the former inspections.

Groundwater, from private wells and community well systems, is the only source of drinking water available to a portion of the residents within three miles of the site. The population utilizing groundwater from wells located within three miles of the site is estimated at 496 individuals. Within the 3 to 4 mile radius, an estimated 882 individuals utilize groundwater obtained from wells for their drinking water. The remainder of the adjacent population is served by the Leland Sanitary District, which provides surface water purchased from Brunswick County, whose intake is located on the Cape Fear River far upstream of the site.

The site area is drained by the Cape Fear River and its tributaries, including Sturgeon Creek. Sturgeon Creek flows 5.5 miles to the Brunswick River, which flows five miles to the Cape Fear River. A 4.5 mile segment of the Cape Fear River completes the fifteen mile length. There are no drinking water intakes along the fifteen path length mile segment downstream of General Wood Preserving Co.; the only drinking water intakes in Brunswick County are located twenty miles upstream of the site.

General Wood Preserving Co. is an operating facility that is apparently in sound financial condition. The site has been, and continues to be, under close supervision by the state regulatory agency that handles RCRA facilities, the North Carolina Hazardous Waste Section. The contamination that was discovered in 1981 when the facility was under Mr.

Robert Morris September 28, 1989 Page 3

previous management was remediated with State approval. The contamination that was recently discovered, in 1988, is being investigated under a compliance order issued by the State of North Carolina. For these reasons, it is recommended that the site be deferred to the RCRA program.

If you have any questions, please call me at (919) 733-2801.

Sincerely,

John P. McConney Environmental Chemist NC Superfund Section

Executive Summary

General Wood Preserving Co., Inc., (GWP Co.) is located near the town of Leland, in Brunswick County, North Carolina. The site was developed by Burke-Parsons-Bowlby Corp. (BPB Corp.) in 1979 as a wood preserving facility. The property was an undeveloped wooded area when the facility was built. In August of 1984, the facility was sold to General Wood Preserving Co., Inc. The property consists of approximately 120 acres, of which approximately the western half has been developed for wood treatment and storage. The remainder of the property is undeveloped and wooded.

The facility was designed to be a complete recycle, non-discharge facility that would effectively contain all toxic and hazardous chemicals used in the treatment process. Under BPB Corp., however, an increase in production, poor operating procedures, spills, and alleged improper waste disposal all helped to contribute to documented soil, groundwater and surface water contamination. Several consent agreements were reached with the State of North Carolina and BPB Corp. funded remedial work at the site. After the facility was sold to General Wood Preserving Co., the new owners appeared to have improved operating conditions. However, in April of 1988, acting in response to a complaint from a former employee that alleged improper waste disposal, state investigators took samples from five areas and found contamination from PCP, Arsenic, Chromium, and creosote constituents. GWP Co. was subject to a Compliance Order with civil penalty assessment in October of 1988. In addition, a criminal investigation was launched by Federal officials. A judgement was entered against General Wood Preserving Co on February 15, 1989 and a penalty was assessed. GWP Co. this paying fine in installments and has retained Westinghouse Environmental Services to perform work required by the Compliance Order.

The site has been inspected and sampled several times by personnel from the NC Solid Waste Management Division. For this reason, personnel from the NC Superfund Section did not conduct a site investigation visit. All sample data presented in this report are from sample results from the former inspections.

Groundwater, from private wells and community well systems, is the only source of drinking water available to a portion of the residents within three miles of the site. The population utilizing groundwater from wells located within three miles of the site is estimated at 496 individuals. Within the 3 to 4 mile radius, an estimated 882 individuals utilize groundwater obtained from wells for their drinking water. The remainder of the adjacent population is served by the Leland Sanitary District, which provides surface water

purchased from Brunswick County, whose intake is located on the Cape Fear River far upstream of the site.

The site area is drained by the Cape Fear River and its tributaries, including Sturgeon Creek. Sturgeon Creek flows 5.5 miles to the Brunswick River, which flows five miles to the Cape Fear River. A 4.5 mile segment of the Cape Fear River completes the fifteen mile length. There are no drinking water intakes along the fifteen path length mile segment downstream of General Wood Preserving Co.; the only drinking water intakes in Brunswick County are located twenty miles upstream of the site.

General Wood Preserving Co. is an operating facility that is apparently in sound financial condition. The site has been, and continues to be, under close supervision by the state regulatory agency that handles RCRA facilities, the North Carolina Hazardous Waste Section. The contamination that was discovered in 1981 when the facility was under previous management was remediated with State approval. The contamination that was recently discovered, in 1988, is being investigated under a compliance order issued by the State of North Carolina. For these reasons, it is recommended that the site be deferred to the RCRA program.

1.0 Background

1.1 Location

The General Wood Preserving Co., Inc., (GWP Co.) is located near the city of Leland, Brunswick County, North Carolina. The county code is 10 and this is in the Seventh Congressional District. The longitude is 078 04' 30" West and the latitude is 34 15' 00" North (10).

1.2 Site Layout

General Wood Preserving Co. is located in a rural area. The property consists of approximately 120 acres, of which approximately the western half has been developed for wood treatment and storage. The remainder of the property is primarily wooded and is undeveloped. Surface drainage from the developed portions of the property is to a series of railroad drainage ditches which bound the property to the north and east of the site. Most of the land surrounding the property is undeveloped, with the exception of a chemical facility and adjoining spray irrigation field to the west and several small businesses located between the General Wood site and the highway (4).

1.3 Ownership and Site Use History

The site was developed by Burke-Parsons-Bowlby Corp. (BPB Corp.) in 1979 as a wood preserving facility. The property was an undeveloped wooded area when BPB Corp. built the facility. In August of 1984, the facility was sold to General Wood Preserving Co., Inc., the current operator (4).

The manufactured product includes treated lumber and poles used for foundation piles, utility poles, pier construction, and similar uses. Some railroad ties are also treated at the site. The wood treatment process includes debarking, trimming and classifying the logs, reducing the moisture content by either a steam kiln or by vacuum, and treating the poles under pressure with chemical preservatives. The preservatives used at this facility are creosote, pentachlorophenol (PCP) and copper-chromium-arsenic (CCA) solution (4).

The facility was designed to be a complete recycle, non-discharge facility that would effectively contain all toxic and hazardous chemicals used in the treatment process. The treatment vessels are equipped with a vacuum system which recovers the treatment liquid and returns it to: a process make up tank, the treatment room floor, or to the

tank farm containment area. The liquid from the sumps located in the treatment area is also pumped to one of the above-mentioned areas. The liquid is then piped to an evaporator pit where it is heated to remove water and is then returned to a process tank (4).

Under BPB Corp., however, an increase in production, poor operating procedures, spills, and alleged improper waste disposal all helped to contribute to documented soil, groundwater and surface water contamination. Inspection Inspection visits by state officials found evaporation vats overflowing onto the ground, puddles containing PCP with levels as high as 11,000 mg/l surrounding said evaporation vats, and soil contaminated with chromium, arsenic, and PCP surrounding the treatment building and evaporation vats. In July 10, 1981, a in the loading area of the facility released approximately 2,000 gallons of Sodium Dichromate. This spill not reported immediately to the state regulatory authorities as required. An earlier spill of 50 gallons of Sodium Dichromate, which was reported, occurred on March 30, Surface water samples taken from the nearby water body, Sturgeon Creek, showed levels of Arsenic and Chromium in excess of water quality standard limits. Evidence of diesel fuel and PCP were also found in this water body. samples taken indicated the presence Groundwater pollutants related to wood preservative chemicals in the aquifer beneath the site (4).

When the facility was sold to General Wood Preserving Co., the new owners appeared to have improved operating conditions. However, in April of 1988, acting in response to a complaint from a former employee that alleged improper waste disposal, state investigators took samples from five areas and found contamination from PCP, Arsenic, Chromium, and creosote constituents. The areas sampled were near the treatment building, the kiln, an old impoundment site and a junkpile. In addition, approximately 37 drums that were later shown to contain hazardous waste were found in a scrap yard area. The condition of these drums ranged from open topped to crushed or corroded (4).

1.4 Permit/Regulatory History and Remedial Actions to Date

General Wood Preserving Co., Inc., currently has status under RCRA as a generator with ID Number NCD 093 137 636. The facility does not have a NPDES permit or any other permits (4).

Under BPB Corp. the first application for RCRA status was made on June 1, 1979 for listing as a generator and a Treatment, Storage and Disposal Facility (TSDF). On August 27, 1984, the facility and its ID number were transferred to General Wood Preserving Co., Inc. On July 24, 1986, the listing for General Wood Preserving Co., Inc., was changed

to generator only (4).

Due to the aforementioned spill of approximately 2000 gallons of Sodium Dichromate on July 10, 1981, several consent agreements were reached with the State of North Carolina. The contaminated soil, estimated at 2200 cubic yards, was removed from the loading area where the spill occurred and was put in an impoundment area with a plastic liner and top at BPB Corp. expense. A consent agreement was entered into on February 16, 1983, and required BPB Corp. to build a concrete containment structure in their loading area. This containment structure was to be sufficient to hold 5,600 gallons of liquid material and was to be funded by BPB Corp. In addition, the BPB Corp. was to pay a fine of \$3,000 (4).

Following leachate tests, solidification was chosen as the remedial option for the contaminated soil. A construction contract was signed on September 9, 1983 to: excavate the contaminated soil from the impoundment, spread and level this material on previously stabilized soil, till cement into this material, and allow this mixture to cure until concrete with a strength of 2000 psi. was formed. This remedial work was to be funded by BPB Corp. and was approved by the State of North Carolina on March 23, 1984. A consent agreement was entered into on May 7, 1984, requiring BPB Corp. to install groundwater monitoring wells and to monitor groundwater on a quarterly basis. Monitoring was to continue until BPB Corp. could demonstrate statistically that the groundwater was not contaminated. On September 11, 1985, the State of North Carolina informed BPB Corp. that the obligations in the consent order had been fulfilled (4).

An investigation by State officials in April of 1988 documented the site deficiencies of the facility under General Wood Preserving Co. management. These deficiencies included five areas of improper waste disposal: a scrapyard containing improperly maintained drums, a junkyard, the old impoundment area, a ditch beside the kiln, and the ditch leading from the treatment building. Other deficiencies included the lack of a site waste analysis plan, a closure deficiencies liability coverage. These and Wood Preserving Co. was not demonstrated that General maintaining the site in a manner consistent with proper operating procedures. GWP Co. was subject to a Compliance Order with civil penalty assessment in October of 1988. addition, a criminal investigation was launched by Federal A judgement was entered against General Wood officials. Preserving Co on February 15, 1989 and a penalty was GWP Co. is paying this fine in installments and assessed. has retained Westinghouse Environmental Services to perform work required by the Compliance Order (4).

1.5 Summary Trip Report

A site investigation visit of General Wood Preserving Co. was not conducted by North Carolina Superfund Section personnel. Officials from the North Carolina Hazardous Waste Section, which handles the RCRA facilities, have conducted numerous inspections of the facility. All sample data presented in this report was gathered from sample results from these inspections.

2.0 Environmental Setting

2.1 Topography

General Wood Preserving Co. is located in Brunswick County, North Carolina. Brunswick County is located in the Coastal Plain, which is very low and flat. The highest points are located along the Cape Fear River, near the northeast corner of the county, and are roughly 80 feet above sea level. About one-fifth of the county is occupied by swampy, poorly drained land subject to seasonal flooding. Wide tidal swamps border the short meandering streams that drain areas adjacent to the coast (18). The site drains approximately 1000 feet to an unnamed tributary (UT) of Sturgeon Creek (10). The site itself is essentially level, with a slope of 0% (10). The intervening terrain drops 10 feet in 1,000 feet, which yields a slope of 1.0% (10).

2.2 Surface Waters

The site area is drained by the Cape Fear River and its tributaries, including Sturgeon Creek (18). Sturgeon Creek flows 5.5 miles to the Brunswick River, which flows five miles to the Cape Fear River. A 4.5 mile segment of the Cape Fear River completes the fifteen mile length (10). There are no drinking water intakes along the fifteen path length mile segment downstream of General Wood Preserving Co.; the only drinking water intakes in Brunswick County are located twenty miles upstream of the site (21).

Sturgeon Creek is classified as a Class C Sw water body and is suitable for fish and wildlife propagation, secondary recreation and agriculture. The Sw classification indicates low velocities and other which have characteristics which are different from adjacent streams Along this creek there is seasonal fishing There is boating largemouth bass, sunfish and bass. associated with fishing but little recreational boating and no swimming. Public access is available with one commercial boat ramp (22,23). The Brunswick River is classified as a SC water body and is suitable for fish and wildlife propagation, and secondary recreation (11). The Brunswick River has some sport fishing and commercial fishing such as crabpots, net fishing, and hook and line fishing (23). The Cape Fear River is classified as a SA water body and is suitable for shellfishing for market purposes, primary and secondary recreation, and fish and wildlife propagation (11). The Cape Fear River has quite a bit of commercial fishing including shellfish, shad and mullet (23). In 1987, a total of 704,211 pounds of shellfish and 52,744 pounds of finfish were taken from the Cape Fear River (25).

2.3 Geology, Soils and Groundwater

The basement rocks that underlie the area are present at a depth of approximately 1500 feet in southern Brunswick County. These basement rocks consist of gneiss, schist, granite and metavolcanics. These have a slope of about 20 feet per mile along a line from Elizabethtown to Fort Caswell, just southwest of Southport (18).

The Tuscaloosa Formation, of the Late Cretaceous age, is the oldest sedimentary formation in the area and lies uncomformably on the basement rock. This formation consists of interbedded sands and clays and is presumed to hold salty water. The sand beds are poorly sorted and arkosic, have a micaceous clay matrix, and are lenticular. They form only a small part of the total section. The clay beds are massive and less lenticular than the sands, and predominate in vertical well sections (18).

The Black Creek Formation, of the Late Cretaceous age, lies uncomformably on the Tuscaloosa. This formation is composed of dark-gray fine-grained sandy clay and very fine to very coarse sand; however, the larger part of the formation is composed of clay and sandy clay. The sand occurs as intercalations, a few inches to 30 feet or more in thickness, between the layers of clay. This is not an important aquifer in the area surrounding the site (18).

The Peedee Formation, of the Late Cretaceous age, consists of layers of fine- to medium-grained glauconitic sand and indurated beds of marl. The beds of marl, some of which are limy and cavernous, are associated with the layers of glauconitic sand. The thickness of the Peedee ranges from about 400 feet in the northwestern part of the county to nearly 900 feet in the southeastern part of the county. This is an important aquifer in the area around the the site (18).

The older formations are covered by surficial deposits that are probably of Pleistocene age. These deposits are uneven in thickness and distribution (18). In the area directly underneath the site this surficial deposit is estimated to be between 10-20 feet deep and consists of tan, brown, slightly silty, fine-grained sand, with little very fine-grained sand, roots, thin organic rich seams and local concretions (4). The surficial deposits are important as an aquifer throughout the area. Most domestic wells and a few industrial wells are finished in these deposits. levels in the surficial deposits are generally a few feet below the surface (18). Data from wells located on the site property indicate that the water level is approximately 3 feet BLS (4).

Groundwater in the area surrounding the site is mostly drawn from the surficial deposits and from the upper part of the Peedee formation. There is only one aquifer of concern; this starts in the surficial deposits and extends down into the upper part of the Peedee formation. Wells deeper than 90 feet encounter brackish water (18). According to the well logs of one of the local well drilling companies, Skipper Drilling Co., the average depth of wells in the Leland area is 15-40 feet, with a maximum depth of 50-60 feet. chloride content of the deeper wells makes these unsuitable for drinking water. The productive layer is a coarse sand with clay stringers interspersed throughout; however, these clay stringers do not constitute a consistent confining layer (15). Logs from test bore holes drilled by Westinghouse Environmental Services do not show the presence of a consistent confining layer beneath the site property (4). The water obtained from the surficial deposits generally is suitable for all purposes. A chemical analysis of water from a well near Navassa, located approximately four miles from the site, show results within water quality standards (18).

2.4 Climate and Meteorology

Seasonal	Temperatures:	(^O F)	January	July
		Mean Max.	58	89
		Mean Min.	38	70
		Mean	48	80

Precipitation: (inches) Mean Annual Precipitation: 54
Mean Annual Evaporation: 42

Mean Annual Evaporation: 42
Net Annual precipitation: 12
Mean Annual snowfall: <2

One year 24-hr. rainfall: 3.75

Storm Events: Mean days/year with thunderstorms: 50
Prevailing winds and wind speeds: S at 12
(1,2)

In 1979, the annual emissions inventory for this area was: particulates at 4,206 tons, sulfur dioxide at 16,900 tons, carbon monoxide at 27,812 tons, volatile organic compounds and hydrocarbons at 32,644 tons and nitrogen oxides at 6,236 tons (24).

2.5 Land Use and Population Distribution

General Wood Preserving Co. lies near the town of Leland, in a rural area which is sparsely populated. Most of the land surrounding the property is undeveloped, with the exception of a chemical facility and adjoining spray irrigation field to the west and several small businesses located between the site and the highway. Brunswick County has a population of 49,631 individuals in 860 square miles,

which yields a population density of 58 individuals per square mile (13,14).

2.6 Water Supply

Groundwater, from private wells and community well systems, is the only source of drinking water available to a portion of the residents within three miles of the site. The population utilizing groundwater from wells located within three miles of the site is estimated at 496 individuals (17). Within the 3 to 4 mile radius, an estimated 882 individuals utilize groundwater obtained from wells for their drinking water (17). The nearest well is located 2500 feet from the site (10). These figures are based on a house count using USGS topographic quadrangles and information provided by the nearby towns and the North Carolina Public Water Supply Branch. The remainder of the population is served by the Leland Sanitary District. This Sanitary District obtains its water from Brunswick County, which has a water intake on the Cape Fear River. This Brunswick County drinking water intake is located far upstream of the site and is not threatened by the site (7).

2.7 Critical Environments

There are no five-acre wetlands located downstream within two path-length miles of the site (10). There are no critical habitats of an endangered or threatened species within one mile. There are four critical habitats within NC; the nearest is approximately 25 miles from the site (3).

3.0 Waste Types and Quantities

3.1 Waste Quantities

The amount of waste onsite could not be determined.

3.2 Waste Disposal Methods and Locations

This facility was designed to be a complete recycle, non-discharge facility that would effectively contain all toxic and hazardous chemicals used in the treatment process. Under BPB Corp., poor operating procedures and a large spill caused documented soil, groundwater and surface water contamination. Contaminated soil from the aforementioned spill was stored in a plastic lined impoundment until the remedial action, solidification, took place (4).

After the facility was transferred to General Wood Preserving Co., operating procedures appeared to have been improved. However, in 1988, acting in response to a complaint from a former employee alleging improper waste disposal, investigators from the State of North Carolina documented five areas of improper waste disposal on the facility grounds. Documented soil contamination resulted from this improper waste disposal. At this time, groundwater and surface water contamination has not been documented. In accordance with the terms of the compliance order, GWP Co. has retained Westinghouse Environmental Services to conduct a groundwater and subsurface soil investigation (4).

3.3 Waste Types

The wood preserving materials used at this facility include Pentachlorophenol (PCP), Creosote, and Copper-Chromium-Arsenic solution (CCA). Hazardous waste generation includes K001 bottom sediment sludge from the operation of the PCP and creosote treatment operations (4).

4.0 Laboratory Data Summary

4.1 Inorganic Results

Four areas of the facility were sampled: the junkyard area, an old open drum in a scrapyard area, a ditch beside the treatment building, and the old impoundment area, with two samples taken from this area. No background soil sample was taken. Two of these areas contained contamination that exhibited the characteristics of EP Toxicity: the sample from the junkyard area contained Arsenic at 11 mg/l; the first sample from the old impoundment area contained Chromium at 16 mg/l and the second sample from this area contained Arsenic at 20 mg/l and Chromium at 9.4 mg/l.

(The maximum concentration of contaminants for characteristic of EP Toxicity for Arsenic and Chromium is 5.0 mg/l.)

4.2 Organic Results

Four areas of the facility were sampled: the junkyard area, the old impoundment area, the ditch leading from the treatment building and the ditch beside the kiln. background soil sample was taken. Pentachlorophenol (PCP) was present in samples taken from two of the areas: ditch leading from the treatment building, present at 244 ppm, and in the ditch beside the kiln, present at 190 ppm. Contaminants indicative of creosote contamination present in three of the samples. These contaminants included naphthalene and anthracene, among others. The sample from the old impoundment area contained fifteen compounds, present in amounts that ranged from 50 ppm to 2720 ppm. The samples from the ditch leading from the treatment building and the ditch beside the kiln contained sixteen compounds each, present in amounts that ranged from 35 ppm to 244 ppm. sample taken from the junkyard area contained five compounds, including fluoranthene and pyrene, that were present in low amounts, ranging from 1 ppm to 6 ppm.

Subject: Preliminary Assessment Reassessment
General Wood Preserving Co., Inc. NCD093137636
Wood Treatment Road
Leland, Brunswick County, NC 28451

Dear Mr. Morris:

General Wood Preserving Co., Inc. is located near the city of Leland, Brunswick County, NC. The County Code is 10 and this is in the Seventh Congressional District. The longitude is 078 04 30 and the latitude is 34 15 00.

Site Description

This site was developed by Burke-Parsons-Bowlby Corp. (BPB Corp.) in 1979 as a wood preserving facility. The site was an undeveloped wooded area when BPB Corp. built the facility. In August of 1984, this facility was sold to General Wood Preserving Co., Inc., who has operated it ever since. This facility pressure treats lumber and poles using either copper-chromium-arsenic (CCA), pentachlorophenol (PCP) or creosote treatment.

Disposal History

This facility was designed to be a complete recycle, non-discharge facility that would effectively contain all toxic and hazardous chemicals used in the treatment process. Under BPB Corp., however, an increase in production, poor operating procedures and an accidental spill of Sodium Dichromate, as well as alleged improper waste disposal, caused documented ground-water and surface water contamination.

	6		

Mr. Robert Morris April 28, 1989 Page 2

A consent agreement was reached with the State of NC, the contaminated soil was chem-fixed with concrete and four monitoring wells were installed by Law and Co. When the facility was sold to General Wood Preserving Co. in 1984, the consent agreement was maintained and the new owners appeared to have improved site conditions. However, in 1988, acting in response to a complaint from a former General Wood Preserving Co. employee that alleged improper waste disposal, investigators took samples from five areas and found contamination from Pentachlorophenol, Arsenic, Chromium and Creosote constituents. In addition, numerous drums containing suspected hazardous waste were found in a scrap yard. Some of these drums were open, crushed and/or corroded. Analysis of samples taken from these drums proved these to contain waste. A criminal investigation civil fines assessed. Westinghouse was launched and Environmental Services has been retained to conduct a ground water monitoring program by General Wood Preserving Co (4).

Geology

The site is in Brunswick County, NC. This county lies entirely within the Coastal Plain and is low and flat. The oldest sedimentary formation in this area is the Tuscaloosa Formation of Late Cretaceous age. Where present, the Tuscaloosa is presumed to contain salty water and is not used as an aquifer. Overlying the Tuscaloosa is the Black Creek Formation which consists mostly of clay but contains subordinate layers of fine sand and marl. The Peedee formation lies conformably on the Black Creek formation and underlies much of the county north of the coast. The Castle Hayne Limestone of Eocene age overlies the Peedee formation in a discontinuous layer in the Leland-Navassa area. Surficial deposits, probably of Pleistocene age, cover the older formations over much of Brunswick County (18).

Groundwater Target Summary

A portion of the surrounding population is supplied by a municipal water distribution system, the Leland Sanitary District. This Sanitary District obtains its water from Brunswick County, which has a water intake on the Cape Fear River. This source is far upstream of the site and is not threatened by the site (7). The remainder of the surrounding population, estimated at 1380 individuals, utilize ground water as their primary drinking water source (16,17). There is apparently only one aquifer of concern in this area; the depth to the water table is roughly 3 feet and this extends to an impermeable layer, the Peedee Formation, whose depth varies (12,18). According to Larry Skipper of Skipper Drilling Co., the average depth of wells in the Leland area is 15-40 feet, with a

Mr. Robert Morris April 28, 1989 Page 3

maximum depth of 50-60 feet. The Chloride content of the deeper wells makes these unsuitable for drinking water. The productive layer is a coarse sand with clay stringers interspersed throughout; these clay stringers do not constitute a consistent confining layer (15). Because most users draw from the Castle Hayne and surficial aquifers and because of lack of evidence of an aquitard between surficial and Castle Hayne, this area is treated as having one aquifer of concern.

Surface Water Target Summary

The annual precipitation of this area is 54 inches and the annual evaporation is 42 inches, which yields a net annual precipitation of 12 inches (1). The one-year annual rainfall is 3.75 inches (2). This site drains 1000 feet to a unnamed tributary (UT) of Sturgeon Creek. This Creek is classified as a Class C Swamp Water (SW) water body; that is, this is suitable for uses of lower quality including secondary recreation, fish and wildlife propagation and agriculture. This stream flows into the Brunswick River and this flows into the Cape Fear River, with both of these bodies of water being classified as Class SC, tidal salt water suitable for uses of lower quality (11). Therefore, there are no water intakes within 15 path-length miles of the site. The facility and intervening terrain are essentially flat, with the terrain dropping only 10 feet in 1000 feet, which yields a slope of 1.0% (10). No critical habitats of federally listed endangered species are located within one mile of this site. The nearest critical habitat located within NC is approximately 230 miles or more from the site (3). No areas considered to be wetlands are within two miles of the site (10).

Recommendation

Due to the toxic and persistent nature of the contaminants, the documented groundwater and surface water contamination and the fact that the aquifer of concern in the area is shallow, a medium priority for the site is recommended.

If you have any questions, please contact me at (919) 733-2801.

Sincerely,

John P. Williams

John P. McConney, Environmental Chemist Solid Waste Management Section NC Superfund Branch GROUND WATER MONITORING PLAN
General Wood Preserving Company
Leland, North Carolina
Westinghouse Job No. 4112-88-118

Prepared for:

April, 1989

SECTION 2

SUBSURFACE INVESTIGATION

The subsurface investigation outlined in the General Wood "Subsurface Investigation Plan" entailed the completion of three soil borings at the site. The borings were completed on February 22-23, 1989. The borings provided information on the subsurface soils and hydrogeologic conditions which was used to design the ground water monitoring system.

2.1 SOIL BORINGS AND SITE LITHOLOGY

Five lithologic units were identified using the boring log data. Sand was the predominant sediment encountered during drilling. The surficial unit was tan to brown, slightly silty, mostly fine-grained, organic-rich sand with local occurrences of concretions. This unit was 13 to 20 feet thick.

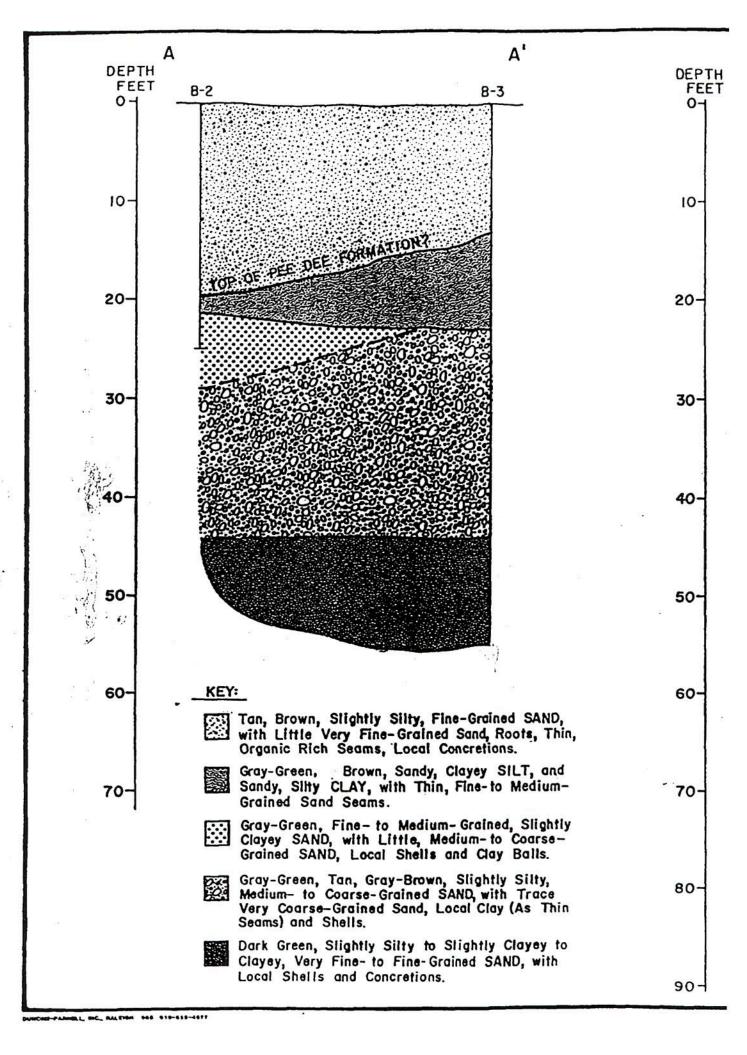

Underlying this sand was a gray-green to brown, sandy, clayey silt to silty, sandy clay with thin interbedded sand seams. This unit was 1.5 to 10 feet thick.

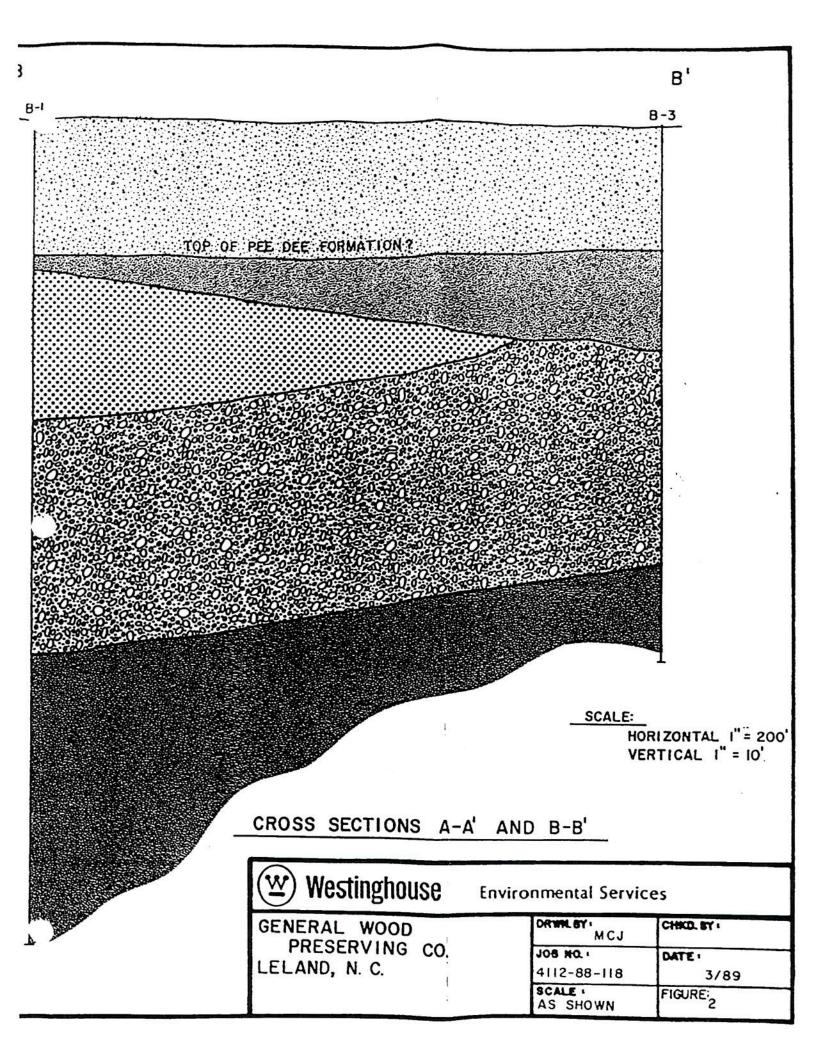

Underlying the silt/clay unit was a gray-green, slightly clayey, fine- to medium-grained sand with local occurrences of shells and clay balls. The unit was 15.5 feet thick in B-1, of undetermined thickness in B-2, and absent in B-3.

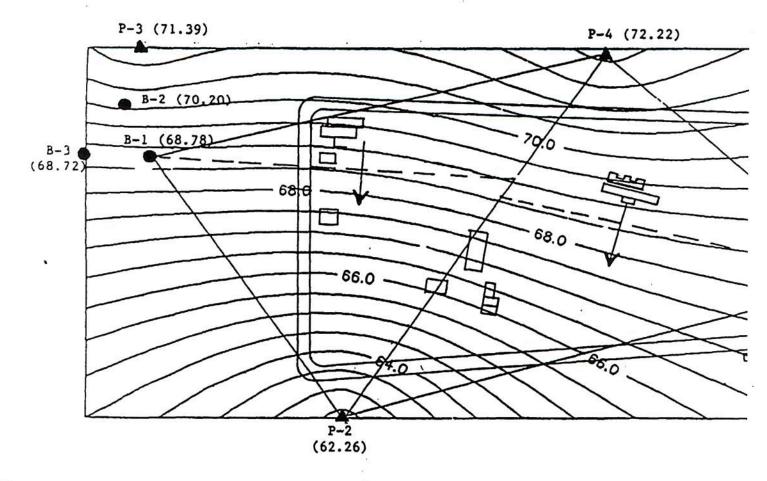

Underlying this unit was a layer of gray-green, tan, gray-brown slightly silty, medium- to coarse-grained sand with local occurrences of thin clay seams and shells. This unit was 23 feet thick in B-1 and 21 feet thick in B-3.

The basal soil unit seen in borings B-1 and B-3 was a layer of dark green, slightly silty to slightly clayey to clayey, very fine- to fine-grained sand with local occurrences of shells and concretions. In boring B-1 two hard zones were

Laboratory Data Summary

Inorganic Results

Four areas of the facility were sampled: the junkyard area, an old open drum in a scrapyard area, a ditch beside the treatment building, and the old impoundment area, with two samples taken from this area. No background soil sample was taken. Two of these areas contained contamination that exhibited the characteristics of EP Toxicity: the sample from the junkyard area contained Arsenic at 11 mg/l; the first sample from the old impoundment area contained Chromium at 16 mg/l and the second sample from this area contained Arsenic at 20 mg/l and Chromium at 9.4 mg/l.

(The maximum concentration of contaminants for characteristic of EP Toxicity for Arsenic and Chromium is 5.0 mg/l.)

Organic Results

Four areas of the facility were sampled: the junkyard area, the old impoundment area, the ditch leading from the treatment building and the ditch beside the kiln. background soil sample was taken. Pentachlorophenol (PCP) was present in samples taken from two of the areas: ditch leading from the treatment building, present at 244 ppm, and in the ditch beside the kiln, present at 190 ppm. Contaminants indicative of creosote contamination present in three of the samples. These contaminants included naphthalene and anthracene, among others. The sample from the old impoundment area contained fifteen compounds, present in amounts that ranged from 50 ppm to 2720 ppm. The samples from the ditch leading from the treatment building and the ditch beside the kiln contained sixteen compounds each, present in amounts that ranged from 35 ppm to 244 ppm. sample taken from the junkyard area contained five compounds, including fluoranthene and pyrene, that were present in low amounts, ranging from 1 ppm to 6 ppm.
